MAINTAINER DECISION · HTML-SLIDES

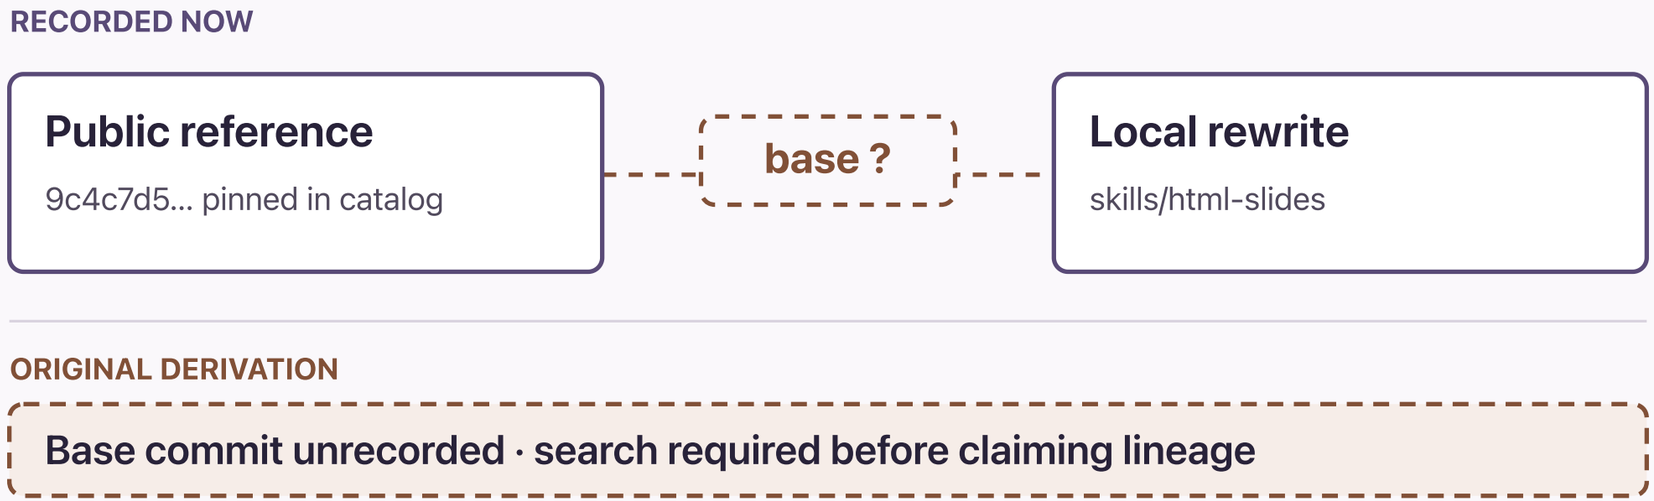

Resolve the provenance gap.

Authorize one bounded search for the local rewrite's original derivation commit.

If the base cannot be established, evaluate a traceable replacement.

THE GAP

A pinned reference does not identify the rewrite's starting commit.

The catalog records a reviewed current baseline and says the original derivation commit is unrecorded.

Source: catalog.yaml · html-slides-reference

OBSERVED EVIDENCE

Both records leave the original base unresolved.

CATALOG RECORD

The public reference is pinned at `9c4c7d5…`; the local rewrite's original derivation commit is not recorded.

catalog.yaml · localChanges

PRODUCT MODEL

The presentation profile remains outside the V1 Solution Skill release set, while the rewrite's original base remains unrecorded.

docs/product-model.md · Release lifecycle

CONSEQUENCE AND PATH

Keep the lineage claim open until evidence closes it.

Inference: the current pin cannot, by itself, support a claim about the rewrite's original base.

01

Search. Review repository history, rewrite records, and candidate upstream snapshots for a defensible base.

02

If unresolved, evaluate replacement. Compare a traceable upstream component and its migration cost before any release change.

DECISION REQUESTED

Authorize the bounded provenance search.

Scope: inspect repository history and documented upstream snapshots once; report the evidence and stop when a base is established or leads are exhausted.

If found	Record the verified derivation commit and review its license and local changes.
If not found	Return a replacement evaluation for a separate decision.
